Author : Martynov, L. A.

Title : Changes in the activity of succino-dehydrogenase and lipase in the organs of rabbits at various stages in the development of fatty dystrophy and during its treatment by certain pharmacological agents

Periodical : Farm. i toks. 17, 30-32, Jul/Aug 54

Abstract : During fatty dystrophy caused by novarsenol, significant changes occur in the activity of succino-dehydrogenase in the heart, kidneys, and liver, but there is no change in the activity of lipase. Prior administration of barbamyl lessens the decrease in succino-dehydrogenase activity, and ascorbic acid increases it slightly. The results of the experiments are given in three charts. Two Soviet references are cited.

TITLE: High chromium steel for heat-resistant castings

SOURCE: Liteynoye proizvodstvo, no. 2, 1965, 9-10

TOPIC TAGS: steel casting, heat resistant casting, heat resistant steel, high chromium steel, steel mechanical property, steel weldability, casting strength/ Kh21L sub ce steel, Kh24N12SL steel, Kh18N19TL steel

ABSTRACT: The authors describe the positive effect of additions (in unspecified proportions) of high-carbon scrap steel, low-carbon scrap ferrochromium, ferrosilicon, ferromanganese, scrap metal mixture and ferrotitanium on the impact toughness, structural coarseness, and casting and welding behavior of Kh21Lce (0.10-0.41% C, 19.5-22.7% Cr, 0.88-2.33% Si, 0.4-0.7% Mn and 0.1-0.5% Ce), Kh24N12SL (0.11-0.20% C, 11.3-14.1% Ni, 23.0-28.0% Cr, 0.75-3.00% Si and 0.2-0.35% Mn) and Kh18N19TL (0.28% C, 9.0% Ni, 16.6% Cr, 1.7% Si and 0.29% Mn) steels. The following properties of castings prepared in the laboratory and in the foundry were investigated: crack resistance, fluidity, heat-resistance

TITLE: Compatibility of high density polyethylene with polyisobutylene

SOURCE: Plasticheskiye massy, no. 10, 1965, 6-8

TOPIC TAGS: polyisobutylene, polyethylene plastic, electric cable, crystalline polymer, amorphous polymer, polymer structure, elasticity, elongation, tensile stress, composite material

ABSTRACT: Reduction of rigidity in cable made of high density polyethylene by incorporation of amorphous polyisobutylene (PIB) was examined. X-ray examination of compositions comprising partially crystallized high density polyethylene with 5-20% amorphous PIB showed that the two polymers are incompatible. Introduction of PIB to the polyethylene improved its elasticity and increased its resistance to cracking, but progressively reduced its strength. Maximum relative elongation was obtained with 5% PIB. Improvement in the elastic properties of the composition is explained by increase in the amorphous phase content and decrease

TITLE: Changes of the crystalline structure of polypropylene in the thermal aging process

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 8, no. 3, 1966, 376-379

TOPIC TAGS: crystalline polymer, crystallization, polymer, amorphous polymer, thermal aging, annealing, molecular structure, oxidation, heat effect

ABSTRACT: It was observed that during the thermal aging of polypropylene, its crystallinity and microcrystal sizes grow at the beginning of the process, and then the polymers become amorphous. The samples oriented without sufficient annealing during the elongation lose their orientation and, conversely, those with small natural orientation become better oriented. In thermally decomposed samples, one can observe not only the spherulitic structure but also a number of different molecular structures, including monocrystals. The described changes

TITLE: Influence of route conditions on the power loading of engines

SOURCE: Rechnoy transport, no. 8, 1966, 26

TOPIC TAGS: ENGINE PERFORMANCE CHARACTERISTIC,  
hydrofoil, marine engine, exhaust gas, inland waterway transportation/  
Raketa hydrofoil, Meteor hydrofoil

ABSTRACT: Investigations carried out on Raketa and Meteor hydrofoils operating with the Volga-Don River Fleet have revealed that the power loading of their engines varies considerably while they are under way. Two diagrams show the variations in exhaust gas temperatures appearing over a 13-hr course and using various accelerations and turns lasting approximately 2 min. Under unfavorable conditions, a power increase from 150 to 800—900 hp could take place within a few seconds. The simultaneous lifting on foils and turning effected a 100°C increase in exhaust gas temperature. An unfavorable distribution of a great number of passengers increases the power loading of the engine; however, this increase can be held within allowable limits by correctly performing the acceleration and turning maneuvers. Generally, the speed developed by a hydrofoil and its engine's exhaust-gas temperature depend on the air and wave-

TITLE: Remarks on the Entrance Examinations on Physics for the Omsk Machinebuilding Institute (Zamechaniya o privyaznykh ekzamenakh po fizike v Omskiy mashinostroitel'nyy institut)

PERIODICAL: Fizika v Shkole, 1958, Nr 2, pp 49-50 (USSR)

ABSTRACT: The results of above mentioned examinations were very satisfactory. The author finds that in general, pupils showing poor theoretical knowledge were very often at a loss when solving real problems. The author insists that teachers must give more attention to the development of the pupils' capabilities to think clearly and precisely.

TITLE Fragment yields of fast neutron fission of  $U^{235}$  and  $U^{238}$

SOURCE Krupchitskiy, F. A., ed. Neytronnaya fizika; st. 1. Moscow 1961. 224-234

TEXT. Results of fragment yield measurements carried out in 1953-1955 dealt with  $U^{235}$  and  $U^{238}$  were fissioned by 14.5 Mev neutrons and fission neutrons. The relative fragment yield with respect to the  $Mo^{99}$  yield and the absolute yield in  $Mo^{99}$  were determined. Pressed  $10^{-50}$  g  $U_3O_8$  tablets were put into a hermetically sealed container.

A  $U^{235}$  multiplication system without a moderator, and a converter which transformed thermal neutrons into fission neutrons were used as fission neutron sources. The specimen was bombarded by an integral neutron flux of  $2 \cdot 10^{13}$ . A tritium-saturated zirconium target which was bombarded with

## Fragment yields of fast

$^{150}$ -kev protons served as 14.5-Mev neutron source. The integral neutron flux onto the specimen was  $\approx 10^{14}$ . The irradiation time was  $\approx 10^{-3}$  sec. The fission fragments were separated from the irradiated samples by isotope dilution. The fragment yields were determined from their beta activity by end window counters with a  $\approx 20 \mu$  thick mica window of 20 mm diameter of 20 mm. The results are summarized in Table I. The overall probability of a symmetrical fission largely depends on the excitation energy of the compound. For  $^{92}_{\Lambda}^{35}$  the ratio  $r$  between the fraction  $\alpha$  of a symmetrical fission and the maximum yield increased from  $\approx 0.1$  at thermal neutron fission to  $\approx 0.5$  in fission induced by  $14.5$  Mev neutrons and to  $\approx 0.7$  in the fission with  $4.5$  Mev neutrons. The ratio  $r$  decreased with increasing the excitation energy of the compound.

The distribution of the fragment yields of fission induced by  $14.5$  Mev neutrons is shown in Fig. 1. The distribution of the fragment yields of fission induced by  $4.5$  Mev neutrons is shown in Fig. 2. The distributions of the fragment yields of fission induced by  $14.5$  Mev neutrons were obtained by M. I. Leibner, L. F. Borodiski and Y. I. Surovtsev [1] for irradiated samples with neutron fluxes  $\approx 10^{14}$  sec $^{-1}$  cm $^{-2}$ . A comparison of the distributions in Figs. 1 and 2 shows that

TITLE: Enrichment of U<sub>237</sub> using the Szilard-Chalmers method  
and uranyl dibenzoyl methane

PERIODICAL: Radiokhimiya, 1961, Vol.3, No.4, pp. 508-509

TEXT: The Szilard-Chalmers method, which is based on the formation of recoil nuclei, is frequently used to separate isotopes of the bombarded element which are formed in a nuclear reaction. The following conditions must be observed in using this method: a) the recoil energy of the atom formed must be sufficient to break chemical bonds; b) the isotopes formed and the atoms of the original element should be in different chemical forms; c) the atoms formed during the bombardment should not exchange in their new chemical form with atoms of the irradiated chemical compound. The Szilard-Chalmers method has been used to concentrate U<sub>239</sub> (Ref. 2: J.W. Irvine, Phys. Rev., Vol.55, 1105 (1939). Ref. 3: K. Starke, Naturwiss., Vol.30, 577 (1942). Ref. 4: L. Melander, Acta Chem. Sland., Vol.1, 2, 169-177 (1947).
